

Health, Number and Acres of Tree Islands In WCA-2A and WCA-3

Note: Historic trends from 1950 to 1985 were estimated.

Figure 1. Historic values for the Index of Forest Health assumes that tree islands in 1940 were near optimum health (this will require further study). An interim tree island target is a positive trend for this index and no net loss. An Interim Target for WCA1, Big Cypress and Everglades National Park should be to maintain current density and health.
